

Recent applied geochemistry research in Africa contributes towards understanding causal cofactors of diseases of unknown aetiology*

T.C. Davies

Regional Councillor for Southern Africa, Association of Applied Geochemists, Faculty of Natural Sciences, Mangosuthu University of Technology, 511 Mangosuthu Highway, Umlazi 4031, KZN, South Africa Email: theo.clavellpr3@gmail.com

<https://doi.org/10.70499/TDUQ1370>

SUMMARY

In the past few years, there has been increasing realisation of the importance of the possible role of geochemical variables as causality cofactors of diseases of unknown *aetiology (DUA) as well as occasional disease outbreaks in various geographical regions of Africa. This relationship has triggered a flurry of research initiatives on the Continent in understanding the geochemical fluxes of both nutritional and potentially toxic elements (PTEs) in the groundwater-soil-food crop continuum, that largely define the nutritional quality of the African diet, and hence the correct balance of micronutrients and vitamins in metabolic processes.

WATER, SOIL AND AIR POLLUTION

By far the largest volume of applied geochemistry research in Africa over the last 3 to 4 years (2017 - 2020) has centred around an understanding of the geochemical circulation of nutritional and potentially toxic elements (PTEs) in the water, soil and air environments (Table 1). This is consistent with the growing realisation of the important role of nutritional elements in shaping the diet, the criticality of their "optimal range" of intake in metabolic processes and hence, in warding off disease (e.g., Failla 2003). In the same way, knowledge of the fluxes of PTEs in the water, soil and air environments is essential for designing nutrient management strategies that would limit their (PTE) entry into the food chain.

Projects involving pollution studies of the water, soil and air environments have been conducted with respect to the source of pollutants - from agricultural activities, industrial activities, mining, leachates from dumpsites, and so on. These studies have been widely supported in recent years, thanks to a favourable shift in international funding policies. For example, results from the completed UNESCO/SIDA funded IGCP 594 and 606 projects on: 'Environmental Health Impacts of Mining (on the water, soil and air environments) in Africa' have been compiled in two Special Issues of the Journal of Geochemical Exploration (JGE): (Kribek *et al.* 2014, v. 144, Part C; and Toteu *et al.* 2019, v. 204/205), both of which have, since publication, experienced an extraordinary download rate.

Water Pollution

Groundwater obtained from wells and boreholes constitutes the main source of drinking water for many African communities; but this water is often of low quality since many of these wells are located close to sanitary facilities (Fayiga *et al.* 2018). Thus, much of the recent research on water chemistry and pollution in Africa has centered around the detection of unacceptably high values of PTEs in water bodies; in particular, those from which drinking water is tapped. The objective of these studies has been to decipher the health implications and proffer mitigative measures (e.g., Gilbert *et al.* 2017; Enitan *et al.* 2018; Adewoyin *et al.* 2019; Nwankwo *et al.* 2020; Ricolfi *et al.* 2020).

Soil Pollution

Identified sources of soil pollution in Africa include agricultural activities, mining, roadside emissions, auto-mechanic workshop effluents, leachates from refuse dumps and e-waste (Fayiga *et al.* 2018). Oil spills are a major problem in large oil-producing African countries such as Nigeria and Angola.

Soil micronutrient (B, Fe, Cu, Mn, Mo, Se, Zn, Cl, Co, etc.) deficiencies are a major problem for crops, livestock and people, and is a subject keenly researched at present (see e.g., Hengl *et al.* 2017). So also, are the consequences of an excess of PTEs in the soil. The last few years have therefore seen a substantial rise in research effort in understanding PTE fluxes in the soils, with the objective of assessing the health implications of unacceptably high levels of these elements (see e.g., Dalton *et al.* 2018; Nde & Mathuthu 2018; Odukoya *et al.* 2018; Kapwata *et al.* 2020; Kihara *et al.* 2020; Okereafor *et al.* 2020). The British Geological Survey (BGS) Project (2015 - 2020): "Strengthening African capacity in soil geochemistry to inform agriculture and health policies" (BGS, Updated 2020) clearly embodies these objectives.

Air Pollution

Despite the increasing awareness that has produced a surge in air quality research, there is still a dearth of air quality data in Africa. Air pollution in African cities stems largely from sources that include particulates and smoke from fossil fuel combustion, vehicular emissions, roadside dust containing pathogens and indoor radon concentrations in ambient air (e.g., see Davies 2015).

* In the field of medicine, *aetiology* or *cause* is the reason or origination of a disease, or of a pathology (essential nature of disease) (Ross, 2018).

Recent applied geochemistry research in Africa... *continued from page 13*

Table 1. Breakdown and ranking of Africa's recent (2017 - 2020) applied geochemistry output (based on internet searches of 07.09.2020)

Rank	Area of Activity (Field Campaigns; Research; Publications; etc.)	Output (%)	Remarks
1	Water Quality	49.0	Proliferation of research on water chemistry and pollution has been a result of the need to understand health risks posed by unacceptably high levels of toxic elements in potable water supplies, as well as the realisation by all stakeholders that climate change would exacerbate the already dire water quality situation that currently exists on the Continent
2	Air Quality	33.3	The upsurge in research effort on air quality is in line with global activities in the area of atmospheric chemistry, to address climate change and health issues. In Sub-Saharan Africa where most of the Continent's mining activities are concentrated, the air quality situation is most serious, especially with regard to radon entry into homes, and its accumulation in deep underground mines
3	Soil Quality (Contaminated Land)	10.2	The main sectors responsible for soil pollution in Africa are mining, agriculture and waste disposal. A huge research effort supported by international funding has been mounted to address this, through measures such as phytoremediation. Much effort is being expended in understanding the processes and mechanisms of uptake of nutritional and PTEs from the soil through food crops, and their roles in mediating metabolic processes and influencing immune system functions
4	Climate Change Chemistry	4.1	A flurry of activities is taking place, in line with the trend of research on atmospheric chemistry and global change phenomena
5	Medical Geology (Environmental Geochemistry and Health)	1.5	As the link between geochemical cofactors and certain environmental diseases becomes clearer and more firmly established, we will continue to see a rise in research activities in this field
6	Isotope Geochemistry; inorganic and biogeochemical processes	0.4	A significant rise in the use of chemostratigraphy and isotopic dating is realised, as researchers begin to appreciate the potential of both stable and radiogenic isotopes to provide answers beyond the reach of geology
7	Geochemistry Aspects of Waste Disposal [Including Mine Wastewaters (AMD)]	0.3	The geochemical aspects of hazardous and non-hazardous waste disposal in Africa remain poorly researched. This is apart from the subject of acid mine drainage (AMD), which continues to be of immense environmental concern, particularly in South Africa - one of few African countries with established institutional structures for articulating waste disposal policies
8	Marine Geochemistry	0.3	The volume of research on marine geochemistry in Africa is very low. Surprisingly, little geochemistry is applied in exploration for offshore resources, despite the many petroleum discoveries made in the last few years
9	Geochemistry in Agriculture	0.3	Research continues to grow in the area of chemical technology, that would help farmers improve yields, while at the same time limiting fertilizer use
10	Geochemistry in Mineral/ (Ore) Exploration (GMOE)	0.3	Numerous geochemical exploration programmes were mounted or continued during the period under review, largely by mining companies. However, many geochemical and mineral target maps that are generated are not put in the public domain, for reasons of confidentiality, which, partly explains the unexpected low ranking of GMOE. Some geochemical exploration work is also carried out by government geological survey agencies and academics in universities; but this proportion, has declined significantly in recent years
11	Urban Geochemistry	0.2	Some data are available for the separate compartments of the water, soil and air environments; but this area of AG research in Africa is still very much in its infancy
12	Extraterrestrial Geochemistry	0.1	The volume of research on Extraterrestrial Geochemistry is low compared to work done in other continents; but awareness of its importance is growing [See below, Sections 2 and 3 of: The European Association of Geochemistry-The Geochemical Society (EAG-GS) Outreach Programme to Africa on 'Africa Initiative for Planetary and Space Sciences']
		100.0	

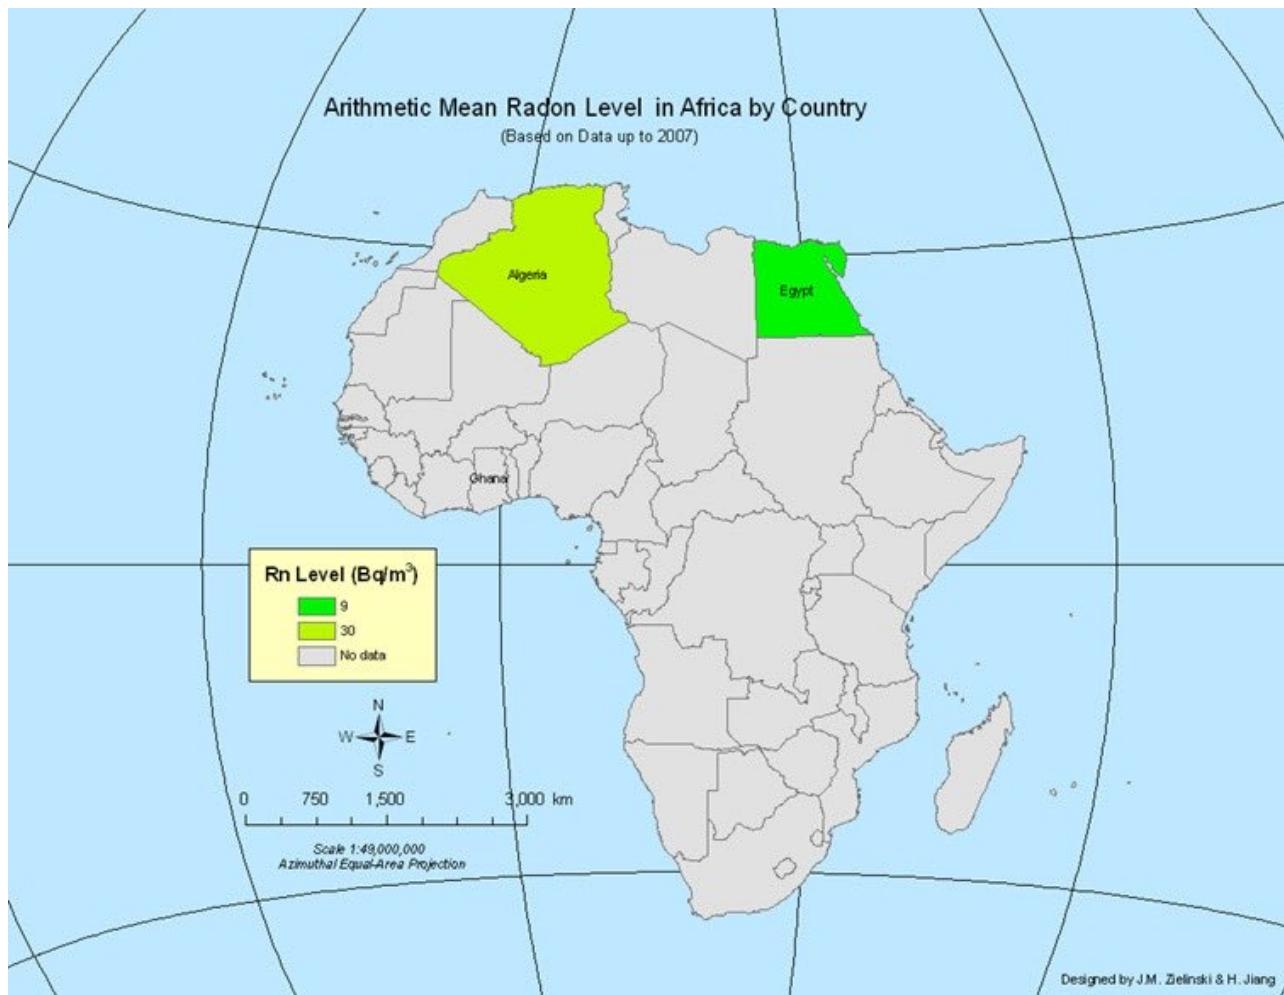

The following quote from a new (2019) UNICEF Report, appositely summarises the present situation regarding air quality: "Because air pollution is not monitored in Africa to the same extent as in other parts of the world, we are not only potentially underestimating the impact - we might also not know how bad it is until it is too late. ... only about 6% of children [in Africa] live near reliable, ground-level monitoring stations that provide real-time data on the quality of air they are breathing - and it is likely that we are only scratching the surface in terms of understanding its full impact on children's health. This is compared to about 72% of children who live near reliable monitoring stations across Europe and North America. Increasing the base of reliable, local, ground-level measurements would greatly aid effective responses to this poorly-understood killer of children across the continent." Exposure to airborne radon progeny in the domestic environment, but also in deep underground mine settings, yields the largest source of exposure to ionising radiation of the population.

Recent applied geochemistry research in Africa... *continued from page 14*

Radon research in Africa

There is a dearth of studies on radon concentrations and its fate in the African geosphere. This situation is well reflected in the data-deficient radon map (Zielinsky 2014; Fig.1) presented during a World Health Organisation project launch of 2017. However, greater awareness of the severity of the health consequences of radon exposure in homes and deep underground mines of Africa has brought about a rise in the number of studies on 'Radon in Africa' in the last 4 years (e.g., Botha *et al.* 2017; Kamunda *et al.* 2017; Masevhe *et al.* 2017; Botha *et al.* 2018; Bezuidenhout 2019; Herbst/CANSA 2019; Le Roux *et al.* 2019; Moshupya *et al.* 2019). Most of these studies address radon exposure situations and health effects in South Africa. Thus, a lot more needs to be done to tackle radon exposure problems in other African countries, especially in homes located in the neighbourhood of uranium and gold mining centres and over large areas of felsic intrusive rock.

GEOCHEMICAL VARIABLES AS PLAUSIBLE CAUSALITY CO-FACTORS IN SUDDEN DISEASE OUTBREAKS AND OTHER 'DISEASES OF UNKNOWN AETIOLOGY' (DUA)

Sudden physical and/or chemical changes in soil, water or air composition as a result of some geological/geochemical/biochemical phenomena or some other geoenvironmental attributes such as latitude, altitude or seasonal variations at specific localities, ought to be considered more deeply by teams investigating the causes of enigmatic disease outbreaks whose aetiology cannot be immediately identified. Other categories of DUAs should also be considered in a similar vein.

Nodding disease, observed in Southern Sudan and *Noma*, observed in many parts of Sub-Saharan Africa, are examples of diseases for which the aetiological agents, until now, remain elusive. Some examples of DUA whose aetiology may well be linked with a geochemical or other geoenvironmental cofactor are described in Table 2.

Recent applied geochemistry research in Africa... continued from page 15

Table 2. Probable geoenvironmental co-factor(s) in some diseases of unknown aetiology (DUA)

DUA	Presentation	Geographical Distribution/Irridence	Geochemical (Including Trace Element Mediated Immune Response)	Geographical Patterns/ Climatic or Seasonal Variations	Remarks
Acrocyanois	Acrocyanois is a peripheral vascular disorder which presents as a persistent bluish or cyanotic discolouration of the extremities, most commonly occurring in the hands	Geographical locale (latitude; urban versus rural setting) uncertain - Kurkinsky et al. 2011	Chronic As toxicity - Tseng 1977; Mak 1988	Cold climate - Crocq 1996; Carpenter 1996; Cold environments - Das & Maiti 2013; Kent & Carr 2020	"Diagnosis remains mostly clinical, and pathological mechanisms vary, suggesting that the association of As with metal sulphide ores, such as those containing Au, in African greenstone belt settings, is well known (See e.g., Davies, 2008). The greatest threat of As poisoning, especially in its inorganic form (WHO 2018), is posed to persons involved with the mining industry; but, the risk is also high among populations that depend on shallow or deep groundwater for domestic purposes in and around the greenstone terrains (See e.g., Smedley & Kinniburgh 2001). Drinking water from these sources commonly contain As levels above the WHO provisional guideline value of 10 µg/l" (Ravenscroft et al. 2009)
Acute Febrile illness	Acute febrile illness (AFI) is characterised by malaise, myalgia (pain in muscle or group of muscles) and a raised temperature that is a nonspecific manifestation of infectious diseases in the tropics (Bastkaran et al. 2019)	Sub-Saharan Africa; Tropics and Sub-Tropics	Viral respiratory tract infections - Crump et al. 2013; D'Acremont et al. 2014; Fe, Zn, Ng and Ca not significantly related to fabrite convolution - Amoulan et al. 2013	Clear seasonal trend - Kaboré et al. 2020	The mechanisms by which these environmental stimuli and viruses initiate asthma or cause worsening of the disease are still unknown - Kostakou et al. 2019
Acute Severe Asthma	Asthma is characterised by chronic airway inflammation, resulting in periodic wheeze, cough and breathlessness (See Carlsson & Bayes 2020).	Worldwide	Respiratory tract infections - Johnson et al. 1995; Jackson & Johnston 2010; Air pollution - Guarnieri & Balmes 2014; Shimod et al. 2014	Cold weather - Hyrkas et al. 2016; Weather changes - D'Amato et al. 2018	The mechanisms by which these environmental stimuli and viruses initiate asthma or cause worsening of the disease are still unknown - Kostakou et al. 2019
Alzheimer's Disease (AD)	Alzheimer's disease (AD) is the most common neurodegenerative disorder and the leading cause of dementia (i.e., the particular group of symptoms shown). It becomes worse with time (deteriorative). The symptoms expressed are as a result of the damage or destruction of nerve cells (neurons) in parts of the brain involved in thinking, learning and memory (cognitive function)	By 2050, the global prevalence of dementia was estimated at 9.9 % in people aged 60+ years, with the regional prevalence being 1.6 % in Africa, 4.0 % in China and Western Pacific regions, 4.6 % in Latin America, 5.4 % in Western Europe, and 6.4 % in North America (Qui et al. 2009).	Significantly different (P less than 0.05) mean concentrations of Br, Cl, Ce, Hg, N, Na, P and Rb were observed in AD bulk brain samples compared to controls - Elman et al. 1986; Varying trace element relationships with AD severity, with Al deposits greater in severely affected AD brain - Jagannatha & Rao et al. 1999; Loew & Walach 2012; Bagheri et al. 2018; Liu et al. 2019; Abnormal concentration levels of metals in metal-binding proteins have growth inhibition functions on neurons - Constantiniadis 1991; Richartz & Bräuer, 2002; Trace metals and abnormal metal metabolism influence protein aggregation, synaptic signaling pathways, mitochondrial function, oxidative stress levels, and inflammation, ultimately resulting in synapse dysfunction and neuronal loss in the AD brain - De Benedictis et al. 2019	Long-term exposure to O ₃ and PM _{2.5} , along with the current USEPA standards are associated with increased risk of AD - Jung et al. 2015; Association between Alzheimer Dementia mortality rate and altitude - Thielke et al. 2015; Hu et al. 2016; Iaffi et al. 2019; Koester-Hermann et al. 2019; Associations with seasonal temperature - We et al. 2019; Global warming and neurodegenerative disorders - Habibi et al. 2019	In 2019 Alzheimer's Disease International (ADI) estimated that there were over 50 million people living with dementia globally, a figure set to increase to 150 million by 2050 (ADI 2019). In both developed and developing nations, Alzheimer's disease has had tremendous impact on the affected individuals, caregivers, and society.
Chronic Kidney Disease of uncertain aetiology (CKD)	The predominant feature of CKD is tubular atrophy and interstitial fibrosis (thickening and scarring of the tiny air sacs and interstitial tissues in the lungs)	Reported in many parts of the world, especially among rural farming communities. High incidence in low- and middle-income countries over last two decades - Mills et al. 2015; Bikbov et al. 2020. In 2017, the global prevalence of Chronic Kidney Disease (CKD) was 9 - 9% (95% uncertainty interval [UI] 8.5 to 9.8) which is roughly 700 million cases - Cockwell & Fisher 2020	Synergistic reaction between Cd and diabetic-related hypoglycaemia - Edwards & Pruznick 2009; Consumption of polluted wet water suggested need for investigating role of cadmium - Wangasuya et al. 2011; Geographical mapping showed that villages with a high prevalence of CKD are often related to irrigation water sources and/or located below the level of the water table - Jayasekara et al. 2013; Toxins/heavy metals - Jha et al. 2013; Groundwater geochemistry high levels of F, Cd & As - Wiehenge et al. 2015; High incidence of drinking water due to fertilizer runoff - Dharma-Wardana et al. 2015; Rajapake et al. 2016; toxic metal exposure; water pollution - Lunyera et al. 2016; Synergistic reaction between F- and water hardness - Sangunju 2013; Wickramaratne et al. 2017; Balasooriya et al. 2019	Altitude - Almaguer et al. 2013; Heat stress nephropathy due to global warming - Glaser et al. 2016	"There have been several global epidemics of CKD. Some such as 'Iai-iai' disease in Japan and Balkan endemic nephropathy, have been explained, whereas the aetiology of others remains unclear (Gifford et al. 2017)." Those affected do not have common risk factors or underlying conditions that lead to CKD, such as diabetes, immune-mediated glomerulonephritis, or structural renal disease. (Caplin et al. 2019)
Geographic Tongue	Geographic tongue (also known as benign migratory glossitis) is an inflammatory disorder that usually appears in a map-like (geographic) pattern on the dorsum and margins of the tongue. Typically, affected tongues have a bald, red area of varying sizes that is surrounded, at least in part, by an irregular white border	Geographic tongue (also known as benign migratory glossitis) is an inflammatory disorder that usually appears in a map-like (geographic) pattern on the dorsum and margins of the tongue. Typically, affected tongues have a bald, red area of varying sizes that is surrounded, at least in part, by an irregular white border	Fe and Zn deficiency; Vitamin B12 - Oguda et al. 2019; Nardini et al. 2016; Pycnan et al. 2016, 2017	Environmental exposure to Hg - Orlowski & Mercer 1980; Mutter & Yeler 2008; Yeler et al. 2016; Partman et al. 2018; Airborne pathogens or toxins - Rodo et al. 2014, 2016	(i) Thus, these twin studies suggest that environmental factors contribute more to the development of KD than genetic factors among individuals with the same ethnicity. (Hara et al. 2016). (ii) The temporal association between the COVID-19 pandemic and the results of RT-PCR and antibody testing suggests a causal link between Kawasaki disease and COVID-19 (Toubiana et al. 2020)
Kawasaki Disease (KD)	Kawasaki syndrome is an acute, self-limited vasculitis (inflamed blood vessels) of infants and children with unknown aetiology.	KD occurs worldwide; most prominently in Japan, Korea, and Taiwan, reflecting increased genetic susceptibility among Asian populations (Rowley & Shulman 2018).	The epidemiology of KD in Africa is very ill-defined, which inevitably leads to misdiagnosis and the reporting of very few cases. This gives the impression that the condition is rare in Africa - Badoe et al. 2011; Animasahut 2017; Norani & Lakhani 2018. The presentation of KD is similar to that of measles (which is very prevalent in Africa), so the exact prevalence of KD in Africa is difficult to ascertain - See e.g., Badoe et al. 2011; Davaalkham et al. 2011	Decades of research have been unable to pinpoint the cause of the disease, but its distinct seasonality can hardly be in doubt - UCDH, 2013; Lin & Wu 2017; Rydal et al. 2018; Kim 2019; Elkababawi et al. 2020	

Recent applied geochemistry research in Africa... *continued from page 16*

DUA	Presentation	Geographical Distribution/Irridence	Geochemical (including Trace Element Mediated Immune Response)	Geographical Patterns/ Climatic or Seasonal Variations	Remarks
Multiple Sclerosis (MS)	Multiple Sclerosis is a demyelinating disease (a nervous system disease in which the insulating covers of nerve cells in the brain and spinal cord are damaged). This damage disrupts the ability of parts of the nervous system to transmit signals, resulting in a range of signs and symptoms, including physical, mental, and sometimes psychiatric problems (Compton & Coles 2002, Murray et al. 2012), Kister et al. (2013) list 11 specific symptom domains commonly affected in multiple sclerosis: mobility, hand function, vision, fatigue, cognition, bowel/bladder function, sensory, spasticity, pain, depression, and tremor/coordination	Distribution is worldwide. There is a striking latitudinal gradient in multiple sclerosis (MS) prevalence (Simpson Jr. et al. 2011)	Metabolic imbalance of trace elements/metals - Rieder et al. 1983; Smith et al. 1985; Melo et al. 2003; Tamhane et al. 2015; Breitlow & Frederiksson 2016; Jenghorban et al. 2017; Samaddar et al. 2020	People who live in higher geographical latitudes may receive lower levels of sunlight, and therefore have lower vitamin D levels which could explain why there is a higher incidence of MS in countries with higher latitudes - MS International Federation, 2016	People who live in higher geographical latitudes may receive lower levels of sunlight, and therefore have lower vitamin D levels which could explain why there is a higher incidence of MS in countries with higher latitudes - MS International Federation, 2016
Nodding disease	Nodding disease is characterised by an occasional nodding of the head, as in epilepsy, with seizures, stunted growth, and developmental disability sometimes occurring simultaneously.	This is an emerging disease in South Sudan, southern Tanzania, and northern Uganda. The exact prevalence and geographic distribution of the disease in the affected countries is unknown - Korevaar & Visser 2013	Deficiency of Vitamin B6 (pyridoxine) and other micronutrients such as vitamin A, Se and Zn - GUMWHO, 2012	Climate change - Donnelly, 2012; cold weather - Kaiser et al. 2000; Nyogura et al. 2011; Living in the vicinity of fast-flowing streams, the breeding habitat of the black fly - Donnelly 2012	With Se and the other essential elements (micronutrients), we should note that there is a "critical range of intake" for them to perform optimally in metabolic processes (See e.g., Davies 2013)
Noma	Noma (cancrum oris or gangrenous stomatitis) is a severe and progressive gangrenous infection (body tissues die as a result of infection or inadequate blood supply) that affects the mouth and face	Mainly observed in tropical countries, particularly sub-Saharan Africa. True global incidence unknown, but estimated incidence of 30,000–40,000 has been suggested by Strou et al. (2017)	Deficiencies of trace elements and amino acids influencing the efficacy of the immune system: Fe, Zn, cysteine, methionine, serine, and glycine - Barati-Meyer et al. 2003; Mainunthon; Strou et al. 2017; Strou & Barati-Meyer 2020	Patients generally live in extremely poor conditions, frequently located in remote rural areas	Regional maps depicting correlations between the distribution of PD and soil geochemistry which would be very helpful in this aetiological debate, are very rare in the published literature [See an example in: Sun (2018) for PD distribution in the United States]
Parkinson's disease (PD)	Parkinson's disease (PD) is a progressive heterogeneous, multi-system and neurodegenerative nervous system disorder that affects movement. The cardinal features of Parkinson's disease are (i) tremor, mainly at rest; (ii) muscular rigidity, which leads to difficulties in walking, writing, speaking and masking of facial expression; (iii) bradykinesia, a slowness in initiating and executing movements, and (iv) stooped posture and instability (Sian et al. 1999).	Worldwide occurrence. According to the 2016 Dosey and GBD Collaborators Study published in 2018, 6.1 million (95% uncertainty interval [U] 5.0–7.3) individuals had Parkinson's disease globally, compared with 2.5 million (2.0–3.0) in 1990	Association with metal and trace element concentration in urine, serum, whole blood and cerebrospinal fluid - Bocca et al. 2004; Fonte et al. 2004; Gelein et al. 2008; Zhao et al. 2013; Combination of Mo deficiency and purple ingestion - Bourke 2018; Significant association between the PD mortality rates and soil concentrations of Se, Sr, and Mg - Sun 2018; Adan et al. 2020; Lemiale et al. 2020	Existence of seasonality (related to temperature) in Parkinson's disease symptoms - Roval et al. 2017; Improvement of PD symptoms at high altitude - Capita et al. 2018; Thomas 2019	

THE AFRICA GEOCHEMICAL DATABASE PROJECT

The Africa Geochemical Database (AGD) project is the Africa component of a multi-stage global project, 'The International Geochemical Mapping', IGCP Project 259 (see Darnley *et al.* 1995), established to consider how best to provide quantitative data to portray the geochemical diversity of the Earth's land surface. A completed AGD would have a range of environmental applications, not least in the field of Medical Geology.

Between 2017 and 2020, large-scale geochemical activities involving sampling, analyses and data handling techniques related to the AGD were at a low ebb. Only a few geological survey institutions (e.g., Geological Survey of Namibia; Council of Geoscience of South Africa) recorded further work on regional geochemical database programmes. Reasons for the lowly position of the AGD in geoscience agendas of African countries are well articulated in the 2018 Annual Report of the International Union of Geological Sciences Task Group on Global Geochemical Baselines (IUGS-CGGB, 2019). A number of international workshops with significant African participation were held during the period under review, at which various technical aspects of the Global Geochemical Database Project, useful to the AGD campaign, were highlighted.

In 2017, the GEO Group on Earth Observations tabled for a second time, the Project Proposal (Activity ID77): "Africa Geochemical Baselines", analogous to the AGD Project, for support by EuroGeoSurveys, IUGS/IAGC and others (GEO 2016). The Project's aim was: "To develop a land base multi-element geochemical baseline database for mineral resource and environmental management". The Proposal also described a work programme for the period 2017 - 2019. The Project is within the vision of GEO: "To realise a future wherein decisions and actions, for the benefit of humankind, are informed by coordinated, comprehensive and sustained Earth observations and information" and "To develop a geochemical baseline database for the entire African continent through systematic sampling and chemical analysis according to the specifications of IGCP 259 International Geochemical Mapping (Darnley *et al.* 1995). We propose using only one sample

Recent applied geochemistry research in Africa... *continued from page 17*

medium, depending on terrain type, namely overbank or floodplain or catchment basin sediment, which is generally alluvial (or agricultural soil)."

Analytical Geochemistry

Among the reasons given for the low scientific output in the AGD Programme (geochemical sampling, laboratory analyses, data processing and data portrayal) is the problem of inadequate capacity in analytical instrumentation across Africa; so also is the lack of technical expertise for its operation. Problems associated with the poor analytical geochemistry performance of African laboratories are highlighted in the 2018 Annual Report of the IUGS Task Group on Global Geochemical Baselines (IUGS-CGGB 2019).

The European Association of Geochemistry-The Geochemical Society (EAG-GS): Outreach Programme to Africa

Under the auspices of the EAG-GS, the following events were held during the period under review:

1. EAG-GS 2017 – The Short Course: "Early Earth Life and Mineral Systems" (presented by Assoc. Prof. Axel Hofmann, University of Johannesburg, South Africa), explored the relationship between surface processes, evolution and habitat of life, and the formation of mineral deposits on the early Earth. It investigated the geochemical, mineralogical, environmental and biological evolution of the Earth's surface and immediate subsurface from its volcano-sedimentary record 4.0 to 2.0 billion-years-old.
2. EAG-GS 2018 – "Africa Initiative for Planetary and Space Sciences" produced two International Workshops held in February, 2019 (First Africa Initiative for Planetary and Space Science Workshop, Addis Ababa, Ethiopia) and May, 2019 (Eastern Africa Global Navigation Satellite Systems and Space Weather Capacity Building, Pwani University, Kenya), respectively.

The Workshops' objectives were:

- To connect African Planetary and Space Scientists with their international peers;
 - To build a road map for Planetary and Space Sciences in Africa, by identifying key research areas where African scientists can make significant contributions;
 - To solicit sponsors to support the development of this research domain in Africa;
 - To contribute to sustainable development in Africa through research, education, and public outreach in Planetary and Space sciences.
3. The 2019-2020 EAG-GS "Outreach Programme to Africa" (convened by Hasnaa Aoudjehane, Hassan II University, Casablanca, Morocco) took the form of a series of workshops and seminars on meteoritics and planetary sciences in universities and institutes across Africa during 2019 - 2020.

CONCLUSIONS

The trend in applied geochemistry research in Africa during the last few years has been towards determining the circulation of both nutritional elements and PTEs in the water-soil-food crop nexus, that enters the food chain. The prime motivator of this approach has been the increasing realisation of the significance of the entry - largely through the diet - of varying concentration levels of elements that may be bioavailable for negative interactions in metabolic processes that produce diseases, some of whose diagnoses are still ill-defined (DUA).

It is clear that most DUA's are multifactorial diseases, caused by a complex interplay between genetic factors (polygenic), immunological mediators (trace elements/metals) and various environmental factors, none of which factors would cause the disease on its own. Based on an extensive literature survey on the subject, it is possible to proffer that trace element dynamics/imbalance in metabolic processes may one day be found to play a far greater role in unravelling the aetiology of DUA than has hitherto been realised.

It is suggested that correlation maps from a completed AGD [analogous to what exists for China (see Wang *et al.* 2007), England and Wales (see Rawlins *et al.* 2012), the USA (see Smith *et al.* 2019), and a few other countries] would, among other applications, enable the depiction of areas where *disease clusters* overlie *anomalous* element distribution (in water, soil or air), and so permit an evidence-based statistical assessment of the magnitude of any geochemical component in the disease causative web.

ACKNOWLEDGEMENTS

This work was done during the tenure of a research fellowship at the Institute of Geosystems and Bioindication, Technical University of Braunschweig, Germany; and sponsored by the Alexander von Humboldt Foundation. This report benefitted from review by S. Cook.
